

PQTunnel

Quantum Safe Secure Tunnel

Upgrading E2EE Connection with Post-Quantum Crypto, prevents the "Store Now, Decrypt Later"(SNDL) attacks from future quantum computers.

Zero-Trust E2EE Connection

Identity management in line with Zero Trust Architecture, along with end-to-end encryption technology, provides dual-layer security for connections.

Prevent Malware Spreading

Micro-Segmentation effectively limits the range of impact caused by cyber attacks that differentiates from traditional VPN's structure, in which the entire network may be affected.

One-Stop Policy Management

Centralization of access control and management solve the problem of decentralized access control on traditional architecture.
